

## CCDS GPU Cluster (TC1) - USER GUIDE

<i>Content</i>	<i>Page</i>
Introduction	2
Logging into the cluster	4
Conda Package and Environment	8
SLURM User Guide	15
Guideline for Job Submission	17
Shared Resources	25
Miscellaneous	26
Other Resources for Application	30
Important Notice	31

## Introduction

In CCDS GPU cluster TC1, there are two diverse types of nodes for diverse types of tasks. The initial node you log in to is the **Head Node**, serving as the main access point for the cluster.

**The GPU cards for computation are in those Compute Nodes, NOT in the Head Node.**

The users are **not allowed** to compile and run code on the Head Node. The users must create the job script to submit the computation request (known as **non-interactive job**) to SLURM (**Simple Linux Utility for Resource Management**) job scheduler, for the system to process in the allocated Compute Nodes.

The available resources for the user to utilise for computation is limited by the assigned **QoS** (SLURM-Quality of Service).

### Client Tools to access TC1 Head Node

Name of Program	Description & Purpose	Where to download
PuTTY	<p><b>[SSH Client for Windows]</b></p> <p><b>PuTTY</b> is an open-source software as SSH and Telnet Client for <i>Windows Platform</i>.</p> <p><b>SSH</b> (Secure Socket Shell) is a network protocol that gives users, particularly system administrators, a secure way to access a computer over an unsecured network.</p>	<p>The installer is available online and can be easily located using any search engine.</p> <p><b>Tip:</b> Download the portable edition "putty.exe" – no need to install, ready for use <a href="http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html">http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html</a></p> <p><b>Other Online References:</b> <a href="https://www.ssh.com/academy/ssh/putty">https://www.ssh.com/academy/ssh/putty</a></p>
	<p><b>[ SSH Client for MAC user]</b></p> <p>Beside ssh access via terminal, you may install other SSH Clients to facilitate the connection.</p> <p><b>Online References:</b> <a href="https://www.ssh.com/academy/ssh/putty/mac">https://www.ssh.com/academy/ssh/putty/mac</a> <a href="https://www.puttygen.com/download-putty">https://www.puttygen.com/download-putty</a> <a href="https://termius.com/free-ssh-client-for-mac-os">https://termius.com/free-ssh-client-for-mac-os</a></p>	

### 3 | [RESTRICTED] CCDS GPU Cluster (TC1) - USER GUIDE

<b>WinSCP</b>	<b>[SFTP Client for Windows]</b> <b>WinSCP</b> (Windows Secure Copy) is a free and open-source SFTP, FTP, WebDAV and SCP client for Microsoft Windows <b>SFTP</b> (SSH File Transfer Protocol) is an encrypted or secure file transfer protocol.	The official download site for WinSCP: <a href="https://winscp.net/eng/index.php">https://winscp.net/eng/index.php</a>  <b>Installation tip:</b> Select “Explorer” for user interface style  <b>Other Online References:</b> <a href="https://winscp.net/eng/docs/guide_install">https://winscp.net/eng/docs/guide_install</a> <a href="https://www.puttygen.com/winscp">https://www.puttygen.com/winscp</a>
<b>FileZilla Client</b>	<b>[SFTP Client for MAC]</b>	Download Site for FileZilla: <a href="https://filezilla-project.org/index.php">https://filezilla-project.org/index.php</a>  <b>Other online References of using SFTP on MAC:</b> <a href="https://lemp.io/how-to-connect-to-sftp-mac-os/">https://lemp.io/how-to-connect-to-sftp-mac-os/</a> <a href="https://beebom.com/how-to-use-mac-terminal-ftp-sftp-client/">https://beebom.com/how-to-use-mac-terminal-ftp-sftp-client/</a> <a href="https://tipsmake.com/use-terminal-on-mac-as-ftp-or-sftp-client">https://tipsmake.com/use-terminal-on-mac-as-ftp-or-sftp-client</a>

This User Guide is only providing general information for your kick-start in TC1, and assuming that you already have the basic knowledge of accessing the Linux system via command-line interface:

- Connecting to a Linux server via SSH
- Moving files to a Linux server from your local computer, and vice versa
- Executing Linux commands at command-line

If you want in-depth information, you may visit those suggested **Online References** (*URL*) or search the internet for the required information.

**Online References for Basic Linux Commands:**

<https://serverdale.com/en/linux-commands>

<https://centoshelp.org/resources/commands/linux-system-commands/>

**Online References on how to redirect or pipe the output to a file:**

[https://tldp.org/LDP/intro-linux/html/sect\\_05\\_01.html](https://tldp.org/LDP/intro-linux/html/sect_05_01.html)

<https://linuxconfig.org/how-to-pipe-output-to-a-file-on-linux>

### **Workflow for the user:**

1. Establish your **first access via SSH**. Your home directory will only be created after your first login
2. **Uploading** all the necessary job script, coding, dataset from your host machine to the cluster’s storage (your home directory) **via SFTP client**
3. **Setup and load your Conda environment(s)** with required applications for computation
4. **The GPU cards are NOT in the Head Node**. Do not attempt to execute command to acquire the GPU information and CUDA status in the Head Node e.g., “*nvidia-smi*”, “*nvcc --version*” etc. **Do not attempt to execute your coding in the Head Node**
5. **Submitting the non-interactive job** using SLURM scheduler, for your coding to execute in assigned Node
6. Copy the job output back to your host machine, via SFTP client

## Logging into the cluster

The CCDS GPU cluster is only accessible **within NTU network**

For off-campus access, the user must login to NTU Virtual Private Network (VPN) [ <https://vpngate.ntu.edu.sg> ]

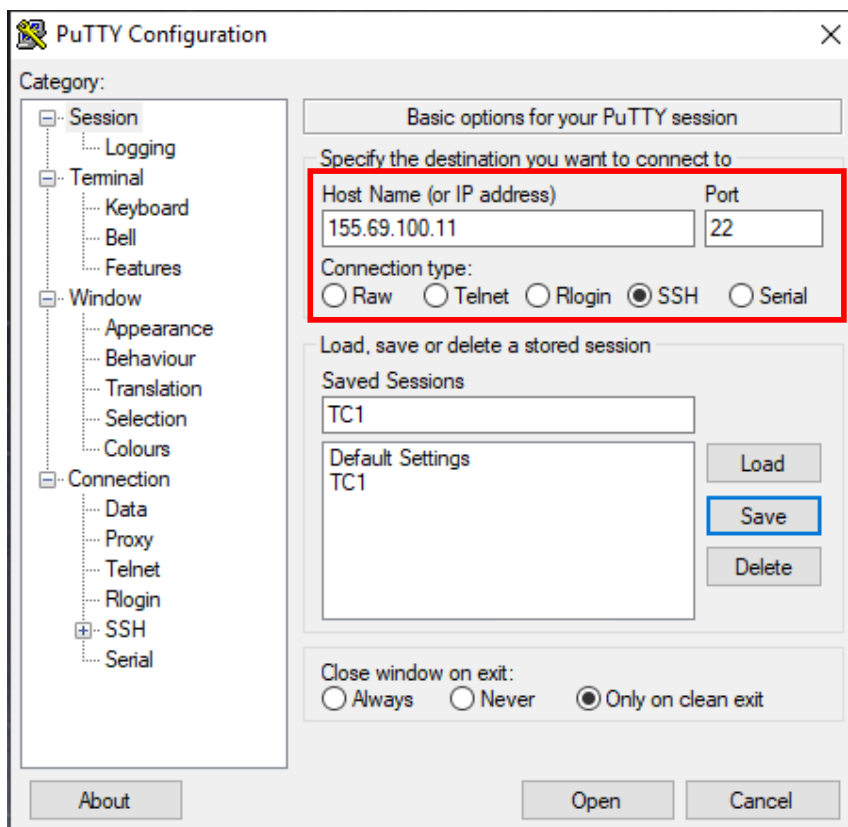

Hostname of TC1 Head Node	<b>CCDS-TC1</b>
IP Address	<b>155.69.100.11</b>
Login Credential	Your NTU Network Account ID ( <i>in Lower Case</i> ) & Password

### SSH via PuTTY

1. Launch PuTTY.

Under the Host Name, enter the IP Address [ 155.69.100.11 ]

Ensure that Port is 22.

2. Examples of command-line access via your LINUX or MAC Terminal:

```
>> ssh -l <Your Username in Lower Case> 155.69.100.11
```

```
>> ssh -p 22 <Your Username in Lower Case>@155.69.100.11
```

3. On your first login, you will be asked to accept the host key.

Do click **“yes”** to continue, and you should get a terminal window, where you will be prompted for your credentials. Log in with your NTU Network Account ID (*in Lower Case*) and password.

```
155.69.100.11 - PuTTY
login as: scetest5
Pre-authentication banner message from server:
/-----\
  **IMPORTANT NOTICE for Users accessing CCDS GPU Cluster TC1**

1. There is NO backup provided for data stored in your home directory.
   You are responsible for protecting your own data.

2. Resources are to be used for academic purposes only. Use of resources
   for a purpose other than that for which they were granted will result
   in the termination of account.

3. Your access and computation are being monitored.
   For unauthorized computation affecting the operation in the cluster
   and for jobs submitted with unauthorized QoS (not assigned for your use),
   will be terminated with no prior notification.
   Severe offender will be barred from the service.

4. DO NOT access directories other than your Home Directory or
   Shared Folders. Unauthorised access may deemed as security breach.
   Serious action will be taken against users committing any breach to
   CCDS GPU Cluster.

5. The user guide (PDF format) for this GPU Cluster is available
   for download from the share folder: /tc1share2.

6. You may execute the command "MyTCinfo" to view your user
   information.

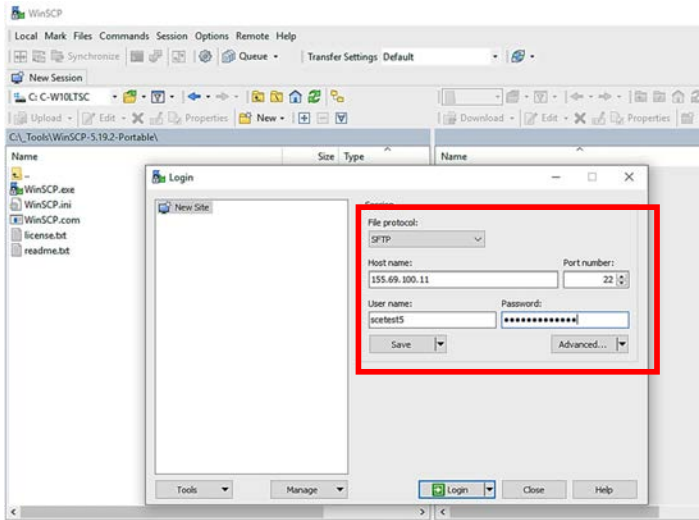

7. For technical issues, please email to ccdsgpu-tc@ntu.edu.sg

\-----/
End of banner message from server
scetest5@155.69.100.11's password: █
```

Best practice to exit the SSH session: type “**exit**” or press the keys **Ctrl + D**

**SFTP via WinSCP/FileZilla – For file transfer between your local host machine and TC1 Head Node**

1. In this example, the client tool using for file transfer is WinSCP.
2. Launch WinSCP. Check that the File Protocol is set to **SFTP**.
3. Under the Host Name, key in the IP Address **[155.69.100.11]**. Ensure that Port is **22**. Key in your **NTU Network Account ID (in lower case)** and **password** for the Username and Password field.

4. Ensure that you are in the correct home directory before transferring your files over. You can verify the pathname of your home directory with following command in SSH session:

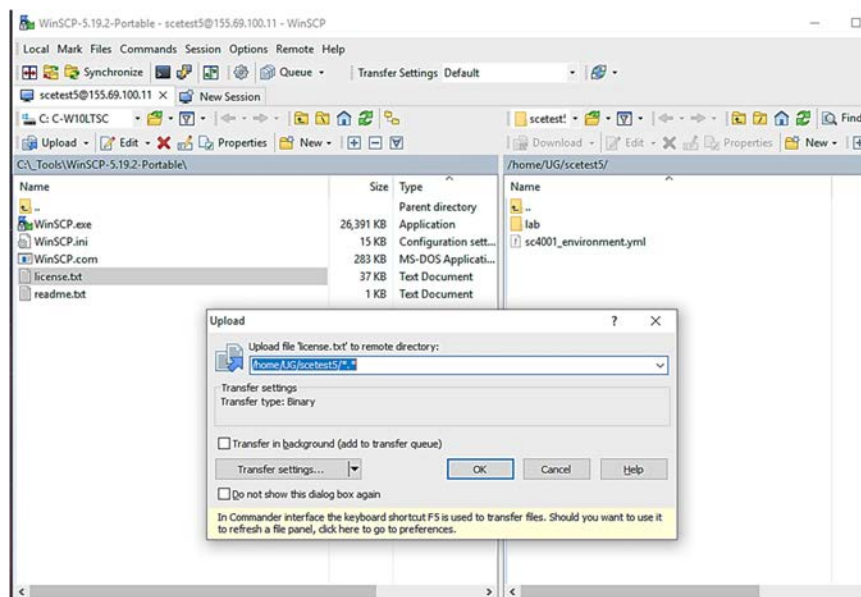

```
>> pwd
```

```
[scetest5@CCDS-TC1:2 ~]$ pwd
/home/UG/scetest5
```

Select the file that you want transfer and press the key “**F5**”

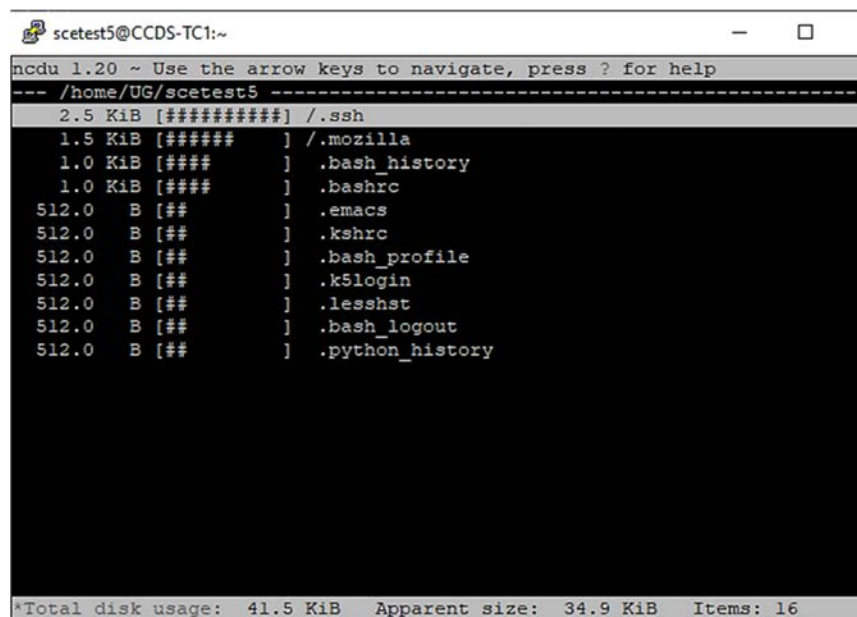

The *Upload-Window* will pop out to transfer the file from your host machine to your home directory.

The *Download-Window* will pop out to transfer file from your home directory to selected local disk in your host machine.

**Maintain Data in Your Home Directory**

1. Your data and computation are bounded within your assigned home directory and share folder (if any).
2. All user directories are set with disk quota limit. The users may have disk quota of at least 100GB, depending on their usage assignment.
3. The user may encounter following issues when the quota usage reached more than 98%:
  - Unable to login
  - Unable to compute data
  - Unable to save in new data, or having data lost
4. You should do regular housekeeping, ensure there is sufficient free space for your computation.
5. Command to verify the disk usage at command line: **ncdu**

```

scetest5@CCDS-TC1:~
ncdu 1.20 ~ Use the arrow keys to navigate, press ? for help
--- /home/UG/scetest5 -----
2.5 KiB [#####] /.ssh
1.5 KiB [#####] /.mozilla
1.0 KiB [####] .bash_history
1.0 KiB [####] .bashrc
512.0 B [##] .emacs
512.0 B [##] .kshrc
512.0 B [##] .bash_profile
512.0 B [##] .k5login
512.0 B [##] .lesshst
512.0 B [##] .bash_logout
512.0 B [##] .python_history

*Total disk usage: 41.5 KiB  Apparent size: 34.9 KiB  Items: 16
  
```

Press the key “q” to abort disk scanning or exit.

**Online Reference on ncdu:** <https://ostechnix.com/check-disk-space-usage-linux-using-ncdu/>

6. Best practices to ensure enough disk space for your computation:
  - Regularly check on the disk usage for your home directory
  - Transfer and backup your data to your personal device
  - Remove unwanted data in your home directory
  - *Do not remove those system directories and files, which naming with a “.” in front, such as “.bash\_profile”, “.bashrc”, “.config” etc*
  - The purpose of the system folder “*.conda*” is to store the packages and environments that you have setup and installed for your computation. *Remove those unwanted environments to free the disk space.*

## Conda Package and Environment

The module package tool is available in TC1, allowing users to easily configure their environment based on the application needed. As this GPU cluster TC1 is shared by users of different undergrad courses and projects in CCDS, there may be applications that are not relevant to you.

To view the available share applications, apply the modules under `/cm/shared/modulefiles`  
**>> module avail**

```
[scetest5@CCDS-TC1:0 ~]$ module avail
----- /cm/local/modulefiles -----
boost/1.81.0          cm-setup/10.0      freeipmi/1.6.10    mariadb-libs        python3
cluster-tools/10.0   cmd                gcc/13.1.0         module-git          python39
cm-bios-tools        cmjob              ipmitool/1.8.19    module-info         rocm-smi/4.3.0
cm-image/10.0        cmsh               lua/5.4.6          null                shared
cm-scale/cm-scale.module dot                 luajit             openssl             slurm/slurm/23.02.7

----- /cm/shared/modulefiles -----
anaconda              gdb/13.1            mvapich2/gcc/64/2.3.7

gcc/13.3.0           miniconda/py312      ucx/1.10.1
gcc/14.1.0           mpich/ge/gcc/64/4.1.1

[scetest5@CCDS-TC1:0 ~]$
```

Description	Command
To view the available share applications	<b>&gt;&gt; module avail</b>
To view the description of a module	<b>&gt;&gt; module show &lt;module_name&gt;</b>
To load the selected module for operation	<b>&gt;&gt; module load &lt;module_name&gt;</b>
To list loaded module	<b>&gt;&gt; module list</b>
To unload the selected module	<b>&gt;&gt; module unload &lt;module_name&gt;</b>
To unload all loaded modules	<b>&gt;&gt; module purge</b>
To know more about the command "module"	<b>&gt;&gt; module --help</b>

```
[scetest5@CCDS-TC1:0 ~]$ module list
Currently Loaded Modulefiles:
 1) slurm/slurm/23.02.7
```

**Note:** The module "slurm/slurm/23.02.7" is being loaded upon every login.  
 This module is required for you to apply those SLURM commands to submit and manage jobs.

## Setup Your own Conda Environment

**In TC1, the user has no right to execute Sudo and install application to the system.**

You may download and install the Anaconda or Miniconda in your home directory for operation.

### Online References:

<https://www.anaconda.com/products/distribution>  
<https://docs.conda.io/en/latest/miniconda.html>

OR apply the available Anaconda in TC1:

Description	Command	Remark
To load the module of <b>anaconda</b> available in TC1	<b>&gt;&gt; module load anaconda</b>	<pre>[scetest5@CCDS-TC1:0 ~]\$ module load anaconda [scetest5@CCDS-TC1:0 ~]\$ module list Currently Loaded Modulefiles:  1) slurm/slurm/23.02.7  2) anaconda [scetest5@CCDS-TC1:0 ~]\$</pre>
To locate the actual path of conda to execute	<b>&gt;&gt; whereis conda</b> OR <b>&gt;&gt; which conda</b>	<pre>[scetest5@CCDS-TC1:4 ~]\$ which conda /tclapps/anaconda3/bin/conda [scetest5@CCDS-TC1:4 ~]\$ [scetest5@CCDS-TC1:4 ~]\$ whereis conda conda: /tclshare1/tclapps/anaconda3/bin/conda [scetest5@CCDS-TC1:4 ~]\$</pre>

## 9 | [RESTRICTED] CCDS GPU Cluster (TC1) - USER GUIDE

For first-time running, to add the <a href="#">conda initialize script</a> into the system file [ <a href="#">~/.bashrc</a> ]	>> <a href="#">conda init bash</a>	<pre>[scetest5@CCDS-TC1:4 ~]\$ [scetest5@CCDS-TC1:4 ~]\$ /tc1share1/tclapps/anaconda3/bin/conda init bash no change      /tclapps/anaconda3/condabin/conda no change      /tclapps/anaconda3/bin/conda no change      /tclapps/anaconda3/bin/conda-env no change      /tclapps/anaconda3/bin/activate no change      /tclapps/anaconda3/bin/deactivate no change      /tclapps/anaconda3/etc/profile.d/conda.sh no change      /tclapps/anaconda3/etc/fish/conf.d/conda.fish no change      /tclapps/anaconda3/shell/condabin/Conda.psm1 no change      /tclapps/anaconda3/shell/condabin/conda-hook.ps1 no change      /tclapps/anaconda3/lib/python3.12/site-packages/xontrib/conda.xsh no change      /tclapps/anaconda3/etc/profile.d/conda.csh modified       /home/UG/scetest5/.bashrc  ==&gt; For changes to take effect, close and re-open your current shell. &lt;==  [scetest5@CCDS-TC1:4 ~]\$</pre>
For the change to take effect in your home environment and load the base environment of TC1 anaconda ( <a href="#">base</a> )	>> <a href="#">source .bashrc</a>	<pre>[scetest5@CCDS-TC1:4 ~]\$ tail -n 15 .bashrc # &gt;&gt;&gt; conda initialize &gt;&gt;&gt; # !! Contents within this block are managed by 'conda init' !! __conda_setup="\$('/tclapps/anaconda3/bin/conda' 'shell.bash' 'hook' if [ \$? -eq 0 ]; then     eval "\$__conda_setup" else     if [ -f "/tclapps/anaconda3/etc/profile.d/conda.sh" ]; then         . "/tclapps/anaconda3/etc/profile.d/conda.sh"     else         export PATH="/tclapps/anaconda3/bin:\$PATH"     fi fi unset __conda_setup # &lt;&lt;&lt; conda initialize &lt;&lt;&lt;  [scetest5@CCDS-TC1:4 ~]\$ source .bashrc (base) [scetest5@CCDS-TC1:4 ~]\$</pre>
To view the information of the loaded <a href="#">anaconda</a>	>> <a href="#">conda info</a>	
To list the applications available in the base environment	>> <a href="#">conda list</a>	
<p>You may also apply the above steps to load the modules of miniconda available in TC1.</p> <p>Do execute the command “<a href="#">conda deactivate</a>” to exit from existing conda environment (if any) and loaded module, before executing the command to load another conda module</p> <p>Example to load the miniconda installed with Python 3.9</p> <p>&gt;&gt; <a href="#">module purge</a></p> <p>&gt;&gt; <a href="#">module load miniconda/py39</a></p>		<pre>[scetest5@CCDS-TC1:3 ~]\$ module load miniconda/py39 [scetest5@CCDS-TC1:3 ~]\$ module list Currently Loaded Modulefiles:   1) slurm/slurm/23.02.7  2) miniconda/py39 [scetest5@CCDS-TC1:3 ~]\$ whereis conda conda: /tc1share1/tclapps/miniconda/py39/bin/conda [scetest5@CCDS-TC1:3 ~]\$ /tc1share1/tclapps/miniconda/py39/bin/conda init bash no change      /tclapps/miniconda/py39/condabin/conda no change      /tclapps/miniconda/py39/bin/conda no change      /tclapps/miniconda/py39/bin/conda-env no change      /tclapps/miniconda/py39/bin/activate no change      /tclapps/miniconda/py39/bin/deactivate no change      /tclapps/miniconda/py39/etc/profile.d/conda.sh no change      /tclapps/miniconda/py39/etc/fish/conf.d/conda.fish no change      /tclapps/miniconda/py39/shell/condabin/Conda.psm1 no change      /tclapps/miniconda/py39/shell/condabin/conda-hook.ps1 no change      /tclapps/miniconda/py39/lib/python3.9/site-packages/xontrib/conda.xsh no change      /tclapps/miniconda/py39/etc/profile.d/conda.csh modified       /home/UG/scetest5/.bashrc  ==&gt; For changes to take effect, close and re-open your current shell. &lt;==  [scetest5@CCDS-TC1:3 ~]\$ source .bashrc (base) [scetest5@CCDS-TC1:3 ~]\$ python -V Python 3.9.19 (base) [scetest5@CCDS-TC1:3 ~]\$</pre>

You are **not allowed** to install any packages in the base environment. If you find those packages in the base environment do not meet your requirement, you may setup own conda environment in the home directory and install the require packages for your operation.

### Commands to manage the Conda environment:

Description	Examples of Command Execution
To create a new Conda environment naming as “ <i>TestEnv</i> ”	>> <a href="#">conda create -n TestEnv</a>
Activate the environment “ <i>TestEnv</i> ”	>> <a href="#">conda activate TestEnv</a>
To exit from the environment “ <i>TestEnv</i> ”	>> <a href="#">conda deactivate</a>
List the environment created in your home directory	>> <a href="#">conda env list</a>

## 10 | [RESTRICTED] CCDS GPU Cluster (TC1) - USER GUIDE

### No command to rename the conda environment

Resolving by cloning the existing env "OldEnv" into another name "NewEnv", then remove the unwanted env

```
>> conda create -n NewEnv --clone OldEnv
>> conda env remove -n OldEnv
```

To export (backup) the configuration of the environment into a .yaml file.

```
>> conda env export > TestEnv.yaml
```

To create or restore the environment from an existing .yaml file, naming as "TestEnv"

```
>> conda env create -n TestEnv -f TestEnv.yaml
```

To update the content of an existing .yaml file, with option "prune" to remove the outdated configuration and dependencies

```
>> conda env update --prefix ./TestEnv --file TestEnv.yaml --prune
```

To remove the environment "TestEnv"

```
>> conda env remove -n TestEnv
```

### Online Reference on managing the conda environment:

<https://docs.conda.io/projects/conda/en/latest/user-guide/tasks/manage-environments.html#creating-an-environment-with-commands>

## Commands to manage the variables in the environment:

Description	Examples of Command Execution
List the variables in the environment	<pre>&gt;&gt; conda env config vars list</pre>
To set a new variable in the environment "my_var1"	<pre>&gt;&gt; conda env config vars set my_var1=value</pre>
To unset (remove) the variable "my_var1"	<pre>&gt;&gt; conda env config vars unset my_var1</pre>
Always re-activate the environment after adding a new variable and removing a variable	<pre>&gt;&gt; conda activate TestEnv</pre>

```
[scetest5@CCDS-TC1:3 ~]$ conda activate TestEnv
(TestEnv) [scetest5@CCDS-TC1:3 ~]$ conda env config vars list
(TestEnv) [scetest5@CCDS-TC1:3 ~]$ conda env config vars set my_var1=10
To make your changes take effect please reactivate your environment
(TestEnv) [scetest5@CCDS-TC1:3 ~]$ conda deactivate
[scetest5@CCDS-TC1:3 ~]$ conda activate TestEnv
(TestEnv) [scetest5@CCDS-TC1:3 ~]$ conda env config vars list
my_var1 = 10

(TestEnv) [scetest5@CCDS-TC1:3 ~]$ conda env config vars unset my_var1
To make your changes take effect please reactivate your environment
(TestEnv) [scetest5@CCDS-TC1:3 ~]$ conda deactivate
[scetest5@CCDS-TC1:3 ~]$ conda activate TestEnv
(TestEnv) [scetest5@CCDS-TC1:3 ~]$ conda env config vars list
(TestEnv) [scetest5@CCDS-TC1:3 ~]$
```

## Commands to manage the package in the environment

The user must always create a new environment to install the package for own use.

Description	Examples of Command Execution
Create and activate the env to install the apps	<pre>&gt;&gt; conda create -n TestEnv &gt;&gt; conda activate TestEnv</pre>
Search for available packages. For this example, search for available python to install, then install the required version.	<pre>&gt;&gt; conda search python &gt;&gt; conda install python=3.11</pre>
To search and install available package from third-party channel	<pre># To search for a package in 3rd party channel "conda-forge" &gt;&gt; conda search -c conda-forge &lt;name of package&gt;  # To install the package from the selected third-party channel &gt;&gt; conda install -c conda-forge &lt;name of package&gt; &gt;&gt; conda install conda-forge::&lt;name of package&gt;</pre>
The conda package manager usually installs the package from the official default channels. You must specify the channel in the command if to search and install package from third-party channel	
<b>conda-forge</b> is one of the third-party channels, providing latest conda packages.	
<b>Online References:</b> <a href="https://docs.conda.io/projects/conda/en/latest/user-guide/concepts/channels.html">https://docs.conda.io/projects/conda/en/latest/user-guide/concepts/channels.html</a> <a href="https://ostechnix.com/enable-conda-forge-channel-for-conda-package-manager/">https://ostechnix.com/enable-conda-forge-channel-for-conda-package-manager/</a>	
List the installed packages	<pre>&gt;&gt; conda list</pre>
Install selected version of the package <i># The installation will replace the existing version (if any) in the environment for operation</i>	<pre>&gt;&gt; conda install python=3.10</pre>
Remove a package	<pre>&gt;&gt; conda uninstall python=3.9</pre>

**Online References:**<https://docs.anaconda.com/anaconda/user-guide/tasks/install-packages/><https://docs.conda.io/projects/conda/en/latest/user-guide/tasks/manage-pkgs.html#installing-packages>**IMPORTANT NOTE:**

Advise to install the packages using **conda install**. Only use **pip install** if the required package is not available through conda.

This is to prevent package incompatibility.

**Remove unwanted Conda environment, to free usage space in your home directory**

1. Exit from the conda environment >> `conda deactivate`
2. List the conda environment in your home directory >> `conda env list`
3. Only remove unwanted environment in your home directory  
>> `conda env remove --name <Name of ENV to remove>`
4. You may also remove the Deactivated conda environment by its folder under `.conda/envs`, e.g.  
>> `rm -Rf ~<your home directory>/.conda/envs/<folder>`

```
[scetest5@CCDS-TC1:3 ~]$ conda env list
# conda environments:
#
TestEnv                /home/UG/scetest5/.conda/envs/TestEnv
base                   /tclapps/anaconda3

[scetest5@CCDS-TC1:3 ~]$ rm -Rf /home/UG/scetest5/.conda/envs/TestEnv
```

## Using CUDA in TC1

**CUDA (Compute Unified Device Architecture)** is a software framework developed by NVIDIA to expand the capabilities of GPU acceleration. In TC1, you may opt to apply the [system installed CUDA \(Nvidia Cudatoolkit\)](#) or [Conda CUDA \(Cuda toolkit installed in your own conda environment\)](#) for computation.

The [NVIDIA GPU cards compatible with CUDA](#) are in the Compute Nodes [ **TC1Nxx** ], not in TC1 Head Node [ **CCDS-TC1** ]. *Do not attempt to execute commands to verify on the GPU and CUDA in TC1 Head Node.*

The access to the system installed CUDA in those Compute Nodes are made available as modules, for the user to load in the job script for execution.

Command to list the available CUDA modules:

**>> module avail | grep cuda**

```
[scetest5@CCDS-TC1:3 ~]$ module avail | grep cuda
cuda/11.8          hwloc2/2.8.0          openm
cuda/12.0          iozone/3.494          openm
cuda/12.2          lapack/gcc/64/3.11.0  pytho
[scetest5@CCDS-TC1:3 ~]$
```

Example to apply one of the above CUDA for your computation into your job script:

**module load cuda/12.2**

The system-installed CUDA available in TC1 may not be applicable to all users' operation.

*You may create own conda environment, to install the required CUDA toolkit or other CUDA related packages, for your computation.*

To install Cuda in own conda environment...

# Example to search for available version of cuda toolkit to install from NVIDIA

**>> conda search -c nvidia cuda-toolkit**

# Example to search for available version of Cuda to install from Anaconda

**>> conda search cudatoolkit**

# Example to install the select version for operation

**>> conda install -c nvidia cuda-toolkit=<version>**

# Example to install NVIDIA CUDA Compiler (nvcc)

**>> conda install -c nvidia cuda-nvcc=<version>**

## How to verify your Conda Environment is complying to your requirement?

- 1) **Example to verify CUDA version installed in your own conda environment @ TC1 Head Node**

**>> conda activate <Name of the Conda Environment>**

**>> conda list | grep cuda**

- 2) **Example to verify your CUDA and Conda Environment @ one of the Compute Nodes**

- a) Create and submit the job to launch **Jupyter-lab**

(Jupyter setup and launching details are available in section “**Shared Resources**” and “**Miscellaneous**”)

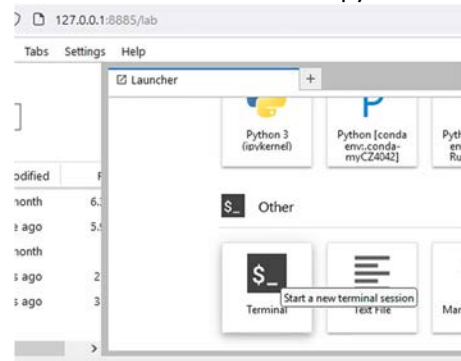

## ➤ Sample of the job script to launch Jupyter Lab

```
[scetest5@CCDS-TC1:3 ~/tc1-jobs]$ more run1.sh
#!/bin/sh
#SBATCH --partition=UGGPU-TC1
#SBATCH --qos=normal
#SBATCH --mem=10G
#SBATCH --ntasks-per-node=4
#SBATCH --gres=gpu:1
#SBATCH --nodes=1
#SBATCH --nodelist=TC1N04
#SBATCH --time=360
#SBATCH --job-name=J1
#SBATCH --output=output_%x_%j.out
#SBATCH --error=error_%x_%j.err

module load anaconda
source activate /tc1apps/2_conda_env/Jupyter
jupyter-lab --ip=$(hostname -i) --port=8882
```

## ➤ Start a Terminal Session in Jupyter Lab

## b) Example to list and activate the available conda environments in your home folder

In the terminal, command to list own conda environments >> `conda env list`

Command to load the selected environment >> `conda activate <Name of the environment>`

```
scetest5@TC1N04:~/tc1-job: X tc1_jobscript.sh X +
(base) [scetest5@TC1N04 tc1-jobs]$ conda env list
# conda environments:
#
RunJupyter                /home/UG/scetest5/.conda/envs/RunJupyter
cuda-python                /home/UG/scetest5/.conda/envs/cuda-python
myCZ4042                   /home/UG/scetest5/.conda/envs/myCZ4042
numba-test                 /home/UG/scetest5/.conda/envs/numba-test
tf-gpu                     /home/UG/scetest5/.conda/envs/tf-gpu
base                       * /tc1apps/anaconda3

(base) [scetest5@TC1N04 tc1-jobs]$
```

c) Example to launch the conda environment, installed with *Pytorch, Pytorch-Cuda and Cuda-nvcc*

```
scetest5@TC1N04:~/tc1-job: X tc1_jobscript.sh X +

The command "which" is to locate the executable file associated with that given command

The command "nvcc -V" is to verify the Cuda version.

## SLURM User Guide

**SLURM** (*Simple Linux Utility for Resource Management*) is a software package for submitting, scheduling, and monitoring jobs on large computer clusters.

In TC1, you are **not allowed** to compile and run your code on the Head Node. You must create a job script to submit your computation request (**non-interactive jobs**) to SLURM Scheduler, for the system to process in allocated Compute Nodes.

The resources for GPU computation are limited by the **QoS** (SLURM-Quality of Service) assigned to you.

Command to view the QoS assigned to the user

```
>> sacctmgr show user <username> withassoc format=user,qos
```

# You may copy and paste the above command to the command prompt in your SSH session window for execution  
# Replace the text "<username>" with your own username

```
[scetest5@CCDS-TC1:3 ~]$ sacctmgr show user scetest5 withassoc format=user,qos
User      QoS
-----
scetest5   normal
[scetest5@CCDS-TC1:3 ~]$
```

# The above example shown the user "scetest5" can use the assigned QoS "normal" for GPU computation

Command to show the resources configured for the QoS:

```
>> sacctmgr -P show qos <Name of QoS> withassoc format=name,MaxTRESPU,MaxJobsPU,MaxWall
```

```
>> sacctmgr show qos <Name of QoS> withassoc format=name%+15,MaxTRESPU%+40,MaxJobsPU%+10,MaxWall%+10
```

# %+<value> is to add value to expand the viewing field

```
[scetest5@CCDS-TC1:1 ~]$ sacctmgr -P show qos normal withassoc format=name,MaxTRESPU,MaxJobsPU,MaxWall
Name|MaxTRESPU|MaxJobsPU|MaxWall
normal|cpu=20,gres/gpu=1,mem=64G|2|06:00:00
[scetest5@CCDS-TC1:1 ~]$ sacctmgr show qos normal withassoc format=name%+15,MaxTRESPU%+40,MaxJobsPU%+10,MaxWall%+10
-----
Name                               MaxTRESPU  MaxJobsPU  MaxWall
-----
normal                             cpu=20,gres/gpu=1,mem=64G      2    06:00:00
[scetest5@CCDS-TC1:1 ~]$
```

Example showing the Resources assigned to above QoS "normal":

1. MaxTRESPU ( *Maximum Trackable RESources Per User* ) :  
cpu ( *Maximum number of CPUs/CORES for the user to deploy* ) = 20  
gres/gpu ( *Maximum number of GPU for the user to deploy* ) = 1  
mem ( *Maximum size of Memory for the user to deploy* ) = 64G
2. MaxJobsPU ( *Maximum number of Jobs Per User, can run at a given time* ) = 2
3. MaxWall ( *Maximum Wall clock time per user, to run the job, DD-HH:MM:SS* ) = 6-hours

The SLURM job script is required, to specify the necessary resources, application, and path to execute your code. Then, submit the job script to SLURM at command line.

Online References on creating the SLURM job script:

<https://slurm.schedmd.com/quickstart.html>  
<https://www.carc.usc.edu/user-information/user-guides/hpc-basics/slurm-templates>  
[https://svante.mit.edu/use\\_slurm.html](https://svante.mit.edu/use_slurm.html)

Common SLURM commands for you to manage the job submission:

Command	Definition (#) & Use Examples (>>)
scontrol	# View the details of a running job, based on its jobid and showing the id of GPU card in the node running the job, under the line "Nodes=TC1N..." >> scontrol show -d jobid <jobid>

seff	<p># Slurm Job Efficiency Report # Display the statistics of resource being utilized by the completed job, allow to review on the resource assignment for the job</p> <pre>&gt;&gt; seff &lt;jobid of completed job&gt;</pre>

## Guideline for Job Submission

### 1. DO NOT execute your coding on the Head Node

The visible impacts are lagging SSH access, freeze data surfing and service suspension, affecting other users accessing TC1.

*For the user process found executing coding and occupying high CPU and Memory usage in the Head Node will be terminated with no prior notification. Repeated offenders will be banned from TC1.*

### 2. Only apply the QoS assigned to you

The job submitted with unauthorized QoS (QoS not assigned for your use) will be terminated by the system with no prior notification.

### 3. Apply the QoS resources within the limit in your job script

Execute the customized script/command to view your account and actual QoS value assigned

>> [MyTCInfo](#)

*Example:*

```
----- User Info of scetest5 in TC1 -----
uid=30720(scetest5) gid=30720(scetest5) groups=30720(scetest5),17184921(tcusers)
Home Directory in TC1= /home/UG/scetest5
=====User Info of scetest5 in SLURM DB=====
-----
User              Cluster              QoS
-----
scetest5          slurm                  normal
=====
==QoS Info=====
-----
Name              MaxTRESPU          MaxSubmit          MaxWall
-----
normal            cpu=20, gres/gpu=1, mem=64G          2          06:00:00
Partition
-----
UGGPU-TC1
-----End-----
```

In your job script, ensure to apply the job flag with stated value below or equal to ( $\leq$ ) the values in the assigned QoS.

**MaxSubmit** The maximum of number of jobs allow to submit at a time  $\leq 2$

*You may submit two jobs to run at a time*

**MaxWall** Total computation of your running jobs must not exceed the maximum wall time  $\leq 6\text{-hr}$

**MaxTRESPU** Total amount of resources allocated in your two job scripts must not exceed the maximum values.  
For example: No of CPU/cores  $\leq 20$ , Memory  $\leq 64\text{GB}$  and No of GPU Card=1, as stated in QoS assigned.

*Note: The QoS resource values may subject to change due to support change for every school semester*

**# Other customized scripts/commands are available under /tc1share2/tc-scripts #**

#### 4. Create/Edit your SLURM job script

You may use the text editor available on your Desktop (e.g., *Notepad in Windows, Sublime Text in Mac, gedit in Linux OS and etc*) to create the job script. Ensuring the job script is saved with file extension “.sh”. Then, transfer to your home directory in the GPU Cluster to execute.

##### Common encounter - > Incorrect file format

In Linux System, the file extension may not determine the actual data format and type for the file. The user has to verify by the Linux command “*file*” to know the actual file type for a file

**Online Reference:** <https://www.linuxfordevices.com/tutorials/linux/file-command-in-linux>

Whenever you transferred the script file from your host machine to TC1, it is advisable to examine the content of the file in TC1 before executing. The common issue encountered by the users in TC1 is unknown characters being found in the job script file and thus failed to submit job.

The example below shows the unknown boxes replaced the characters “-” in a job script.

```
#!/bin/sh
#SBATCH --partition=SCSEGGPU_UG
#SBATCH --qos=normal
#SBATCH --gres=gpu:1
#SBATCH --nodes=1
#SBATCH --mem=10G
#SBATCH --jobname=run1
#SBATCH --output=output_%x_%j.out
#SBATCH --error=error_%x_%j.err

module load anaconda
source activate testenv
jupyter-notebook --ip=$(hostname -i) --port=8886
```

For this case, you have to edit the file in TC1, to correct those unknown characters.

In TC1 Head Node, you may use those linux command line editors to edit your job script: *vi*, *nano* or *ne*

**Online References on Linux Command-line Editors:**

<https://www.guru99.com/the-vi-editor.html>

<https://www.geeksforgeeks.org/nano-text-editor-in-linux/>

<https://itsfoss.com/command-line-text-editors-linux/>

#### The following are the basic job flags to apply in the job script

*The flags with \* must specify in the job script*

Resource	Flag Syntax	Description
Partition*	--partition=UGGPU-TC1	# Specify the node group for your job execution, defines as <i>Partition</i> # Command to list the available Partitions and allowed QoS in the Cluster >> <i>scontrol show partition</i>
QoS*	--qos=normal	# Specify the QoS to apply for the job # The QoS must be one of them allow to execute in the Partition
GPU*	--gres=gpu:1	# Specify the use of GPUs on compute nodes. # The number of GPU card to use is corresponding to the assigned QoS # This option is to be in the job script, to deploy GPU Card for your execution # <i>You may omit this option if confirmed not using the GPU Card for computation</i>
Memory*	--mem=8000M Or --mem=8G	# Specify on the memory to apply for the job. # The value is corresponding to the assigned QoS, must not exceed the assigned maximum memory size. # This option must be present in the job script, for the system to deploy the memory for the computation.
CPUs/cores	--ntasks-per-node=2	# <b>Optional:</b> only add this flag if want to apply more than one core for the computation # Specify the number of “tasks” (cores) per node, for use with distributed parallelism. <i>Default value=1</i>
	--cpus-per-tasks=2	# <b>Optional:</b> only add this flag if want to apply more than one core for the computation # Specify the number of CPU-cores to allocate to per task, for multi-threaded tasks. <i>Default value=1</i>

nodes*	*--nodes=1	# Number of compute nodes for the job # Max node number allows per job = 1
	--odelist=TC1Nxx	# <b>Optional:</b> you may specify the node (hostname: <i>TC1Nxx</i> ) to run the job # xx: 01, 02, 03, 04, 05, 06 or 07 # Command to list those idle nodes and their hostname in the Partition <i>&gt;&gt; sinfo -N   grep idle</i>
Time*	--time=60	# Specify a time limit for the job # Time format: <min> or <min>:<sec> or <hr>:<min>:<sec> or <days>-<hr>:<min>:<sec> or <days>-<hr>
Job name*	--job-name=MyJob	# Name of job
Output file*	--output=output_%.out Or --output=output_%x_%.out	# State the name of the file for standard output <b>Filename patterns:</b> %x: job name %j: job id, generated by SLURM
	--error=error_%.err Or --error=error_%x_%.err	# State the name of the file for error log – if any

The following is an example of a standard job script: *job.sh*

```
#!/bin/bash
#SBATCH --partition=UGGPU-TC1
#SBATCH --qos=normal
#SBATCH --nodes=1
#SBATCH --gres=gpu:1
#SBATCH --mem=8G
#SBATCH --time=60
#SBATCH --job-name=MyJob
#SBATCH --output=output_%x_%.out
#SBATCH --error=error_%x_%.err
```

```
module load cuda/12.1
module load anaconda
source activate TestEnv
python test.py
```

#### Remarks:

You may add necessary flags from the table above. Do note that if you exceed the limit for your QOS, the job will not run.

From this job script, 2 files will be generated upon running:

*output\_%x\_%.out*

➤ The standard output from running the code will be saved here

*error\_%x\_%.err*

➤ Error log from job if any

Load the necessary modules to run the code

Activate your own conda environment (if any)

Run your code

#### Question: Can I adjust the GPU Memory in the job script?

The GPU cards [ NVIDIA Tesla V100 32GB ] in TC1 are with fixed memory of 32GB, not possible to adjust in the job script. Please search online for guide to utilize the desired GPU memory size in your coding.

#### Online References:

<https://www.tensorflow.org/guide/gpu>

<https://wiki.ncsa.illinois.edu/display/ISL20/Managing+GPU+memory+when+using+Tensorflow+and+Pytorch>

## 5. Submit your job script

Action to submit a job	Command
To submit your job script, where job.sh is the name of your job script	<i>sbatch job.sh</i>
The system should respond with a job ID:	
[scetest5@CCDS-TC1:3 ~/jobscript]\$ sbatch hellosubmit.sh	
Submitted batch job 120	

**6. Avoid using the command “*srun*” to submit job**

The command “*srun*” is to submit job at the command line for *real time execution*. You have to maintain your SSH session until the whole process completed. The disconnection of your SSH session may kill the process and causing you to lose the control over the execution. Thus, for the jobs requiring more than an hour to compute, are advised to submit using the command “*sbatch*”.

The command “*sbatch*” is to submit job for later execution, handling by SLURM in the background. Once submitted the job using “*sbatch*”, you may exit from your SSH session, with no consequence.

*To avoid high volume of SSH connections to TC1 Head Node, all users are advised to use the command “sbatch” for job submission. Then exit from the session, access later to see the result.*

**7. Verify on the Node operational status in TC1**

Command to verify on the node status:

>> *sinfo*

Online Reference for SLURM *sinfo*: <https://slurm.schedmd.com/sinfo.html>

```
[scettest5@CCDS-TC1:2 ~]$ sinfo
Fri Jul 19 17:58:19 2024
NODELIST      NODES  PARTITION      STATE CPUS      S:C:T MEMORY  TMP_DISK  WEIGHT  AVAIL_FE  REASON
TC1N01         1  UGGPU-TC1*    mixed  72      2:18:2  386580      0        1  location none
TC1N02         1  UGGPU-TC1*    idle   72      2:18:2  386580      0        1  location none
TC1N03         1  UGGPU-TC1*    idle   72      2:18:2  386580      0        1  location none
TC1N04         1  UGGPU-TC1*    idle   72      2:18:2  386580      0        1  location none
TC1N05         1  UGGPU-TC1*    idle   72      2:18:2  386580      0        1  location none
TC1N06         1  UGGPU-TC1*    idle   72      2:18:2  386580      0        1  location none
TC1N07         1  UGGPU-TC1*    idle   72      2:18:2  386580      0        1  location none
```

Verify the nodes of TC1 via the following common status showing under “*STATE*”

STATE	Description
<i>idle</i>	The node is alive and free to accept job
<i>mixed</i>	There are jobs running in that node
<i>down</i>	The SLURM service in that node has been down
<i>completing</i>	The node is in the process to complete the final job computation
<i>mixed+drain</i>	There are jobs still running in the node. The ‘draining’ means there are failed tasks unable or still in progress to terminate. The result will be degrading in system performance and causing other running jobs in the node to slow down or hang.
<i>draining</i>	For this case, if the administrator resets the affected node, the existing running jobs in the affected node will be terminated. The affected jobs will join the <i>PENDING queue</i> for re-assignment.
<i>drained</i>	The node has failed task, unable to run any job. Requiring the administrator to verify and reset the affected node.

To know the overall status of the nodes in TC1, you may refer to those log files under */tc1share/Log-TC1-Information*  
File format: *ActiveNode-YYYY-MM-DD-HH-mm*

Example to view the status of the active node(s) (with running job) at specific hour of the day e.g., 3pm

>> *more /tc1share/Log-TC1Status/ActiveNode-2024-02-19-15-\**

Example to view the log files of Active Node on 1<sup>st</sup> Feb 2024

>> *more /tc1share2/Log-TC1Status/ActiveNode-2024-02-01-\**

To view the overall node status in TC1

>> *more /tc1share2/Log-TC1Status/TC1\_ClusterInfo*

**8. Verify on the jobs processing in TC1**

Command to verify the current jobs and their status in the queue:

>> *squeue*

Online References for SLURM *squeue*: <https://slurm.schedmd.com/squeue.html>

Actions to check on job status	Command
Display the jobs in the scheduling queue	<code>squeue -la</code>
Display job history for a user <username>	<code>sacct -u &lt;username&gt;</code>
Show the detail for a running/pending job <jobid>	<code>scontrol show jobid &lt;jobid&gt;</code>

```
[scetest5@CCDS-TC1:3 ~]$ squeue
      JOBID PARTITION   NAME     USER ST       TIME  NODES NODELIST(REASON)
      119  UGGPU-TC1 twogpute scetest6 PD        0:00      1 (QOSMaxGRESPerUser)
      120  UGGPU-TC1 hello-wo scetest5 PD        0:00      1 (QOSMaxWallDurationPerJobLimit)
      114  UGGPU-TC1      J1 scetest5 R       47:48      1 TC1N01
      116  UGGPU-TC1 twogpute scetest6 R        3:47      1 TC1N02
[scetest5@CCDS-TC1:3 ~]$
```

In the SLURM job queue, the job failed to run will show with **ST (STATE)** “PD” and reason coded under **NODELIST (REASON)**. The job may fail due to following reasons:

- *The required resources stated in your job script have exceeded the limit set in QoS*
- *TC1 is unable to allocate the required resources for job execution*
- *The job being terminated half-way due to system failure or resource shortage*

The Resource in TC1 is referring to those GPU Nodes and their available CPU, Memory, and GPU Cards.

The resource allocation is first-come, first-served basis. The jobs allocated with the required resources and with no coding issue, may show **STATE** “R” and executing in the assigned node stating under **NODELIST (REASON)**.

The SLURM in TC1 will verify the available resource to allocation at the time of job submission. If failed to allocate the available node and resources to the job, the **STATE** of the job will change to “PD”.

Some common reasons for pending jobs associated to QoS failure (*exceeded any of the values stated for the QoS*):

- **QOSMaxWallDurationPerJobLimit**  
Verify on the flag [ `#SBATCH --time=xx` ], ensure it does not exceed the *MaxWall* of the QoS
- **QOSMaxJobsPerUserLimit**  
Verify on your total number of jobs in Running queue, must not exceed the value stated in “**MaxJobsPU**”.  
The subsequence job may go into the PENDING queue or being rejected.
- **QOSMaxMemoryPerUser, QOSMaxCpuPerUserLimit, QOSMaxGRESPerUser**  
The total resource counts in [ `#SBATCH --mem=x, #SBATCH --ntasks-per-node=x` ] stated in your submitted job scripts using the same QoS, must not exceed the max value stated in “**MaxTRESPU**”.
- **QOSMaxGRESPerUser**  
One(x1) GPU card can only run one(x1) job. This error will appear if you set to use the GPU card in your subsequence job using the same QoS with **MaxTRESPU** stating “`gres/gpu=1`”. If your computation does not require the GPU, you may omit the flag [ `#SBATCH --gres=gpu:1` ] in your job script.

For jobs unable to run or being terminated half-way due to *system failure or resource shortage*, they will go into PENDING queue, and showing following reason codes:

- **Priority**  
The job is waiting with higher priority, will run eventually when the node and resources are available
- **Resources**  
The job is pending for available resources, will run eventually when obtains the allocation

The pending jobs will be removed from the job queue if the waiting time has exceeded the Time Limit (referenced to **MaxWall** stated in the QoS).

**Advice for users with jobs hanging in the PENDING queue:**

- *Cancel your pending jobs failed the QoS limit Check*
- *Review and modify the resource values in your job script*
- *Restrict your number of job submission*

Example to cancel the job	Command
To cancel a job, where 263 is your job id	<code>scancel 263</code>

Once the job execution is completed, it will be removed from the queue. You may see the **output files** for the computation result. If you did not specify a specific path for the output file in your job script, it will be created under the folder where you submitted the job.

```
[scetest5@CCDS-TC1:3 ~/tc1-jobs]$ ls
error_J1_114.err  J1.sh  output_J1_114.out
[scetest5@CCDS-TC1:3 ~/tc1-jobs]$
```

Based on the following flags set in the job script, two output files are being generated.

```
#SBATCH --output=output_%x_%j.out
#SBATCH --error=error_%x_%j.err
```

In above example, the two output files are

*Output\_MyJob\_xxxx.out*  
*Error\_MyJob\_xxxx.err*

Commands to view the content of the file at command line: **cat**, **less**, **more** and **tail**

**Online Reference:** <https://www.cyberciti.biz/faq/unix-linux-command-to-view-file/>

## 9. Know more about your submitted jobs

You may use the customised script to view your job history for the day, with details on applied QoS, allocated resources (cpu, gpu, memory assigned for the job), node assigned, job-submit time, start time, elapsed time, state, and reason

>> **MyJobHistory**

```
scetest5@CCDS-TC1:3 ~]$ MyJobHistory
- list Job History for [ scetest5 ]-
User | jobid | jobname | qos | allocResources | start | elapsed | nodelist | state | reason
-----
scetest5 104 twogputestj+ q ug3x24 billing=2,cpu=2,gres/gpu=3,node=1 2024-07-22T11:55:5 00:00:00 TC1N01 FAILED None
scetest5 105 twogputestj+ normal billing=2,cpu=2,gres/gpu=1,node=1 2024-07-22T11:59:0 00:00:01 TC1N01 FAILED None

```

### # Know the CPU and Memory being utilized by your Completed Job #

Command to display the resource utilization statistics for your completed job, let you review and deploy the right number of resources (CPU/cores and Memory) in your job script, for subsequence computation

>> **seff <job id>**

```
[scetest6@CCDS-TC1:0 ~]$ seff 115
Job ID: 115
Cluster: slurm
User/Group: scetest6/scetest6
State: COMPLETED (exit code 0)
Nodes: 1
Cores per node: 4
CPU Utilized: 00:00:00
CPU Efficiency: 0.00% of 00:00:24 core-walltime
Job Wall-clock time: 00:00:06
Memory Utilized: 1.32 MB
Memory Efficiency: 0.00% of 16.00 B
[scetest6@CCDS-TC1:0 ~]$
```

# Examples of the utilization showing high usage on CPU and Memory

```
State: COMPLETED (exit code 0)
Cores: 1
CPU Utilized: 00:02:16
CPU Efficiency: 144.68% of 00:01:34 core-walltime
Job Wall-clock time: 00:01:34
Memory Utilized: 2.54 GB
Memory Efficiency: 25.40% of 10.00 GB
```

```
State: COMPLETED (exit code 0)
Cores: 1
CPU Utilized: 00:44:59
CPU Efficiency: 103.05% of 00:43:39 core-walltime
Job Wall-clock time: 00:43:39
Memory Utilized: 278.29 GB
Memory Efficiency: 434.83% of 64.00 GB
```

# The user should review own coding and adjust the values of CPU and Memory in the job script to enhance the performance in subsequence computation

### # Know the actual GPU Card being assigned to your Running job #

Using the command "**scontrol**", with option "**-d**"

>> **scontrol -d show jobid <jobid of running job>**

Look for the line "**JOB\_GRES=gpu:x** "

```

NodeList=SCSEGPU-TC1-01
BatchHost=SCSEGPU-TC1-01
NumNodes=1 NumCPUs=10 NumTasks=10 CPUs/Task=1 ReqB:S:C:T=0:0:*:*
TRES=cpu=10,mem=32G,node=1,billing=10,gres/gpu=1
Socks/Node=* NtasksPerN:B:S:C=10:0:*:* CoreSpec=*
JOB_GRES=gpu:1
Nodes=SCSEGPU-TC1-01 CPU_IDs=0-9 Mem=32768 GRES=gpu:1 (IDX:0)
MinCPUsNode=10 MinMemoryNode=32G MinTmpDiskNode=0
Features=(null) DelayBoot=00:00:00
OverSubscribe=OK Contiguous=0 Licenses=(null) Network=(null)

```

# In each Compute Node, the GPU Cards are identified by SLURM as *IDX:0*, *IDX:1* and *IDX:2*

# The above example showing the job is executing on GPU Card 1 in the node CCDSGPU-TC1-01

### # Know the utilization rate of the GPU Card assigned to your Running job #

The actual GPU utilization information in TC1 requiring the root access to retrieve from the active nodes.

The information is being retrieved using the command "nvidia-smi" from respective Compute node

Queries Option	Description
name	Official Product Name of the GPU Card
pci.bus_id	PCI Bus ID
driver_version	The version of the installed NVIDIA Display Driver
pstate	Current Performance state of the GPU Card, ranging from P0 (maximum performance) to P12 (minimum performance)
power.limit	Maximum Power [Watt] can be draw by the GPU
power.draw	Power [Watt] being draw by the GPU for operation
temperature.gpu	Core GPU Temperature, in Degrees C
memory.total [MiB]	Total installed GPU Memory
memory.used [MiB]	Total Memory being allocated by the active contexts
* utilization.gpu [%]	Percent of time over the past second during which one or more kernels was executing on the GPU
* utilization.memory [%]	Percent of time over the past second during which global (device) memory was being read or written

**\* Utilization rates report how busy the GPU is over time, and determine how much the assigned job has been using the GPU.**

```

TC1N02: name, pci.bus_id, driver_version, pstate, power.limit [W], power.draw [W], temperature.gpu, memory.total [MiB],
ib), utilization.gpu [%], utilization.memory [%]
TC1N02: Tesla V100-PCI-E-32GB, 00000000:37:00.0, 535.183.01, P0, 250.00 W, 50.01 W, 55, 32768 MiB, 348 MiB, 100 %, 0 %
TC1N02: Tesla V100-PCI-E-32GB, 00000000:86:00.0, 535.183.01, P0, 250.00 W, 47.09 W, 54, 32768 MiB, 348 MiB, 100 %, 0 %
TC1N02: Tesla V100-PCI-E-32GB, 00000000:D8:00.0, 535.183.01, P0, 250.00 W, 65.07 W, 70, 32768 MiB, 348 MiB, 100 %, 0 %

```

In TC1, the usage records are being retrieved at scheduled timing and keep under the following folders:

S/N	Log Directory and File Format	Remark
1	/tc1share2/Log-RunHistory Log file: RunningJobs_YYYY-MM-DD-HH-mm	Recording running job detected for past 48H, showing the actual GPU being utilized by the job at 5-mins interval
2	/tc1share2/Log-JobHistory Log file: JobHistory_YYYY-MM-DD-HH-mm	Recording the jobs computed for past 48H
3	/tc1share2/Log-TC1Status Log file 1: TC1_ClusterInfo Log file 2: ActiveNode-YYYY-MM-DD-HH-mm	Recording the overall resource utilization of the nodes in TC1 for past 48H

# You may use the command "*more*" to view those files for the day e.g.,

```
>> more /tc1share2/Log-JobHistory/JobHistory_2024-08-09-*
```

### # Do your part to enhance the efficiency of your computation and reduce resource wastage

The job execution and resource assignment are first-come, first-served basis. The amount of resource stated in your job script is allocated accordingly to run the job. For the jobs submitted after you, the resource will be allocating based on the balance. Thus, please help to allocate and utilize the resource reasonably for your computation.

Most users often begin with predefined resource allocations for their tasks, aiming to strike a balance between performance and efficiency. However, this can lead to two extreme outcomes: degradation in performance if resource utilization exceeds 100%, or wastage if utilization remains below 10% of the allocated resources.

The resource utilization statistics (*retrieve using command “[seff](#)”*) enable you to know the actual amount of CPU and memory being deployed for your computation, allowing you to verify and set reasonable values in the job script to enhance subsequent computation. The log files in the above Log Directories “[/tc1share2/Log-\\*](#)” enable you to know whether you have been utilizing the GPU reasonably for your computation.

## Shared Resources

There are shared conda environments ready under `/tc1apps/2_conda_env/`

S/N	Name of Shared Conda Environment	Apps installed	Remarks
1	<code>/tc1apps/2_conda_env/CZ4042_v4</code>	Python 3.10 Pytorch 2.0.1 Pytorch-Cuda 11.7 Cudnn 8.1 Tensorflow 2.9 Cuda-toolkit 11.7	<b>Configured Environment Variable</b> (For Tensorflow 2.9) <code>TF_ENABLE_ONEDNN_OPTS=0</code>
2	<code>/tc1apps/2_conda_env/CZ4042_v5</code>	Python 3.11.4 Pytorch 2.0.1 Pytorch-Cuda 11.7 Jupyter lab + notebook	This Conda Environment is created for the course SC4001/CZ4042  The exported YML file " <code>sc4001_environment.yml</code> " is available under <code>/tc1share/Shared-Info/</code> . You may copy the yml file and setup similar conda environment in own home directory.  Below showing the commands executed to create the conda environment " <code>myCZ4042</code> ": <code>&gt;&gt; cp /tc1share/Shared-Info/sc4001_environment.yml .</code> <code>&gt;&gt; conda env create -n myCZ4042 -f sc4001_environment.yml</code>
3	<code>/tc1apps/2_conda_env/Jupyter</code>	Python 3.10 Jupyter	Jupyter lab + notebook

To launch the shared environment in your job script, simply add in the following lines:

```
>> module load anaconda
>> conda activate /tc1apps/2_conda_env/CZ4042_v5
```

To launch Jupyter lab, you may execute the following lines in your job script. Then, setup the **SSH Tunneling** for the access.

```
module load anaconda
source activate /apps/conda_env/Jupyter
jupyter-lab --ip=$(hostname -i) --port=8888
```

### Note for Jupyter Users

Jupyter is a web-based computing platform to facilitate the user on code development, analyse and debugging.

(You may refer to the next section "**Miscellaneous**" for exemplary guides on Jupyter setup and access)

Usually, the user may exit the SSH session after submitted the job via the command SBATCH. Then, access later to retrieve the job result.

The Jupyter user must setup and maintain the **SSH Tunneling** in the SSH session for the web access and can only exit the session after terminating the Jupyter service in the Web Browser or cancel the job manually.

The default port for Jupyter is 8888. You may change to other port number if it has been in-used by other users in TC1.

You may verify whether your desired port number is being in-used via one of the following commands in TC1 Head Node:

```
>> ss -tp | grep <port number>
>> netstat -tp | grep <port number>
```

```
[redacted]@CCDS-TC1:1 ~/tc1-jobs]$ ss -tp | grep 888
ESTAB 0      0          10.128.10.10:36080      10.128.10.14:8882
ESTAB 0      0          10.128.10.10:47860      10.128.10.14:8882
ESTAB 0      0          10.128.10.10:42374      10.128.10.14:8882
ESTAB 0      0          10.128.10.10:42340      10.128.10.14:8882
ESTAB 0      0          10.128.10.10:36106      10.128.10.14:8882
ESTAB 0      0          10.128.10.10:36078      10.128.10.14:8882
ESTAB 0      0          10.128.10.10:44132      10.128.10.14:8882
ESTAB 0      0          10.128.10.10:42400      10.128.10.14:8882
ESTAB 0      0          10.128.10.10:42364      10.128.10.14:8882
ESTAB 0      0          10.128.10.10:42384      10.128.10.14:8882
ESTAB 0      0          10.128.10.10:42356      10.128.10.14:8882
[redacted]@CCDS-TC1:1 ~/tc1-jobs]$
```

If your port number is not found in the output, then it means that port number is free for use.

For the applications to execute for own computation, you should setup and install in own conda environment via command-line.  
When your coding is ready for computation, you should execute directly via the job script submission, not launching via Jupyter.

## Miscellaneous

### SSH Tunneling

The GPU Cluster is only accessible via SSH connection. For running *Jupyter Lab or Notebook*, the user must setup the SSH tunnel for computation.

SSH tunneling (also known as SSH port forwarding) is a method of creating an encrypted SSH connection between a client and a server through which services port can be relayed.

Exemplary guide:

*Using Putty in Windows Desktop to access TC1, setup own conda environment for Jupyter.*

*Submit the job script to launch Jupyter, obtain the access info from the error log file.*

*Setup the SSH Tunnel in PUTTY, then copy and paste the URL to the web browser to access.*

#### 1. SSH to GPU Head Node and setup a conda environment in your home directory

Description	Execution
Load the anaconda module	# Execute at command line >> <code>module load anaconda</code>
Create and activate the new conda environment	>> <code>conda create -n RunJupyter</code> >> <code>conda activate RunJupyter</code>
Install the required package for Jupyter lab and notebook  <i>Online References:</i> <a href="https://jupyter.org/install">https://jupyter.org/install</a> <a href="https://jupyterlab.readthedocs.io/en/stable/getting_started/installation.html">https://jupyterlab.readthedocs.io/en/stable/getting_started/installation.html</a> <a href="https://www.dataquest.io/blog/jupyter-notebook-tutorial/">https://www.dataquest.io/blog/jupyter-notebook-tutorial/</a>	>> <code>conda install -c conda-forge jupyter</code> >> <code>conda install -c conda-forge nb_conda_kernels</code>
Deactivate/Exit the conda environment	>> <code>conda deactivate</code>

#### 2. Create the job script and submit

Description	Execution
Create the job script to run Jupyter. For this example, the job script is named as "run1.sh"	# Sample of the job script  #!/bin/sh #SBATCH --partition=UGGPU-TC1 #SBATCH --qos=normal #SBATCH --mem=10G #SBATCH --gres=gpu:1 #SBATCH --time=360 #SBATCH --nodes=1 #SBATCH --job-name=run1 #SBATCH --output=output_%x_%j.out #SBATCH --error=error_%x_%j.err  module load anaconda source activate RunJupyter <HERE add in the <b>Command</b> to launch Jupyter Lab or Notebook>
Determine the free port number for your Jupyter access. <i>Default port number for Jupyter is 8888</i>	# Execute at command line to list the ports being in-used >> <code>ss -tp   grep 888</code> # Only apply the port number not shown in the output
<i>Command to launch Jupyter-Notebook, where XXXX is your desired port number</i>	<code>jupyter-notebook --ip=\$(hostname -i) --port=XXXX</code>
<i>Command to launch Jupyter-Lab, where XXXX is your desired port number</i>	<code>jupyter-lab --ip=\$(hostname -i) --port=XXXX</code>
Submit the job script	# Execute at command line >> <code>sbatch run1.sh</code>

### 3. Verify the access information in the error log file

The error log file is being generated under the folder where you executed the job script: [error\\_run1\\_xxxx.err](#).

Use the command “**tail**” to view the access info available at the bottom end of the error log file

>> **tail error\_run1\_xxxx.err**

Online Reference: <https://www.geeksforgeeks.org/tail-command-linux-examples/>

Take note of the **IP address**, **port number** and the **URL with token key** for web access

```
scetest5@CCDS-TC1:~/tc1-jobs
[I 2024-07-22 13:46:19.378 ServerApp] Jupyter Server 2.14.2 is running at:

```

Take note of the IP address and port number showing in the first URL “<http://10.128.10.11:8883/tree...>”.

Input the info to following fields accordingly

**Source port:** 8883

**Destination:** 10.128.10.11:8883

Click on the button **“Add”** to add the new forwarded port

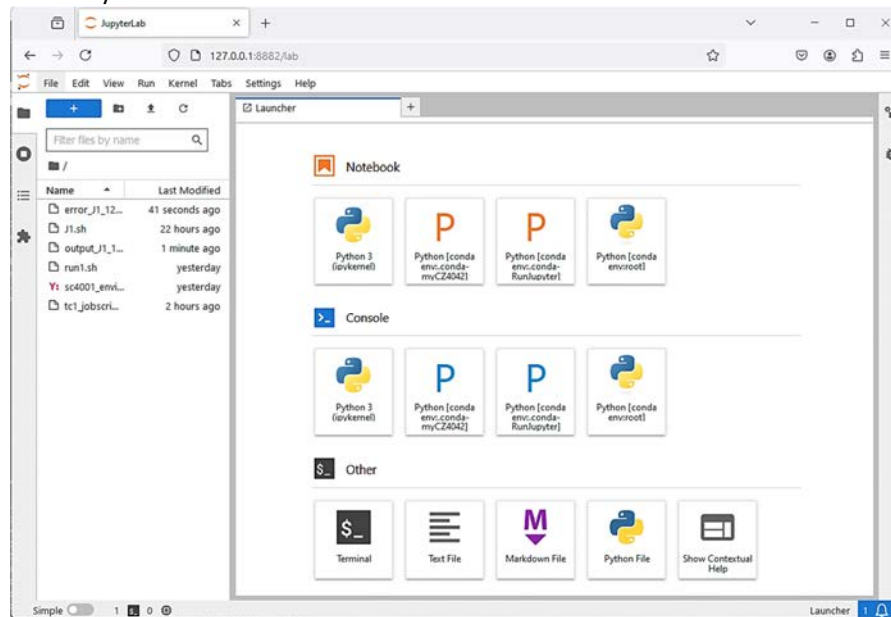

Then, click on **“Apply”** for the change to take effect

6. You may access the second URL in your local machine

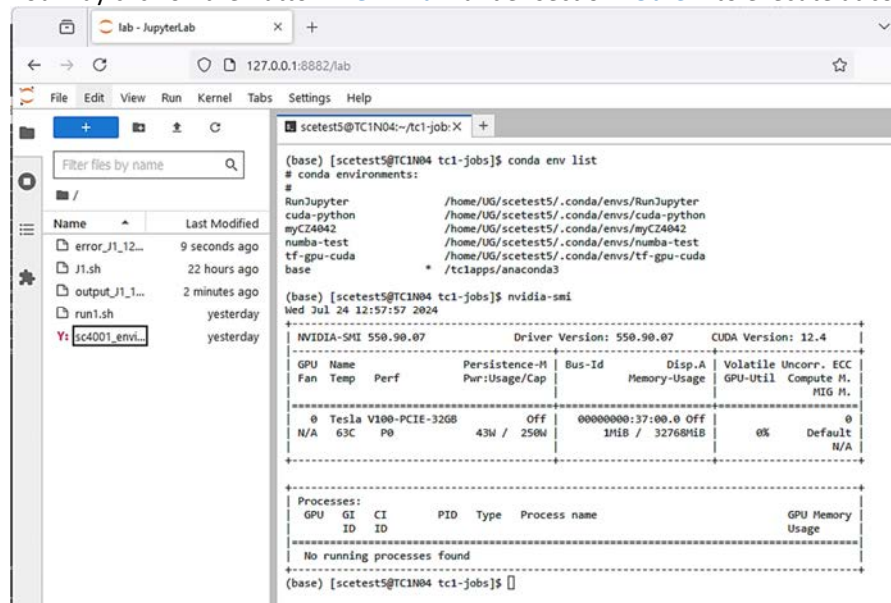

To access the server, open this file in a browser:  
 file:///home/UG/scetest5/.local/share/jupyter/runtime/jpserver-864826-open.html  
 Or copy and paste one of these URLs:  
<http://10.128.10.11:8883/lab?token=f09aa2ea8124a8aca21bd029d06265d832083f42198cdec>  
<http://127.0.0.1:8883/lab?token=f09aa2ea8124a8aca21bd029d06265d832083f42198cdec>

Copy and paste the *second* URL to your web browser for access <http://127.0.0.1:8883/tree?token=8cced.....>

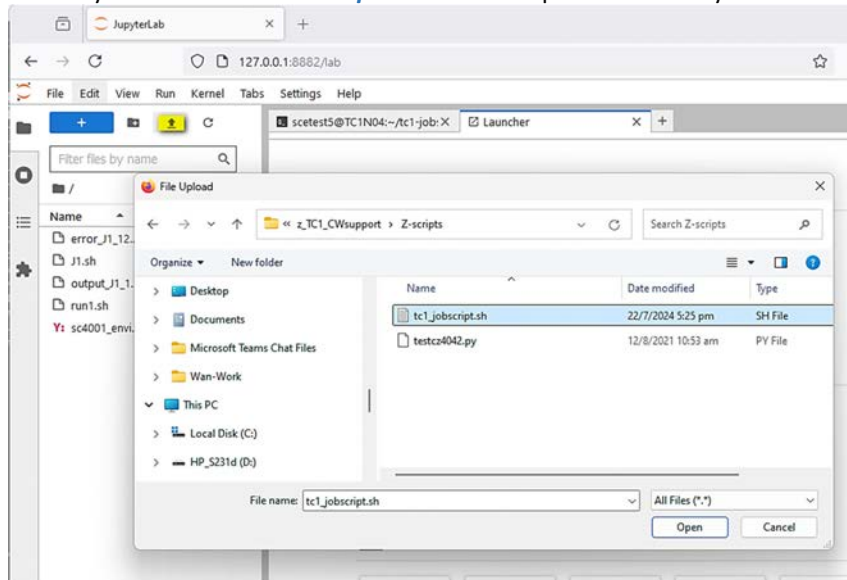

The display in your browser, upon successful access, will be explorer view, showing the files in your home directory:

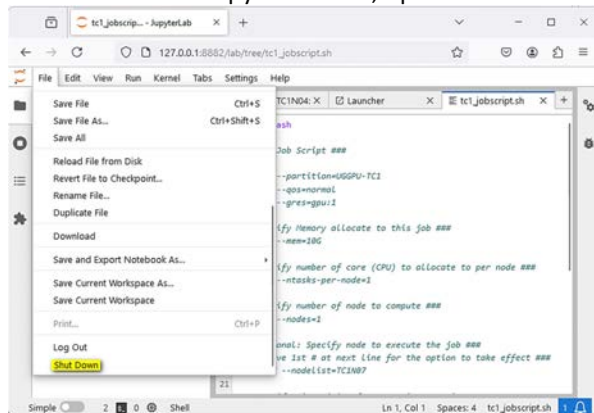

7. You may click on the Button **“Terminal”** under section **“Other”** to execute at command line.

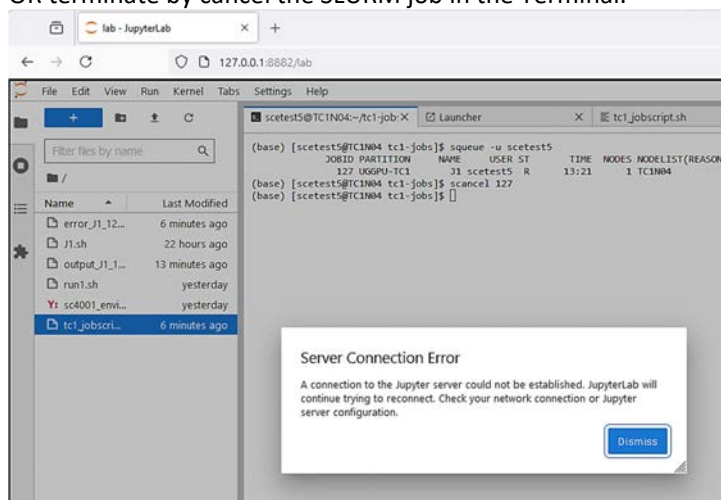

8. You may click on the button **“Upload Files”** to upload file from your local drive to your home directory in TC1.

9. To terminate the Jupyter service, open the menu **“File”**, select **“Shut Down”**.

10. OR terminate by cancel the SLURM job in the Terminal.

#### Note

For MAC and Linux user establishing the ssh session at command line, you may have to search online for command to setup SSH tunneling at command line. OR you may install other SSH Clients to facilitate the connection:

<https://www.ssh.com/academy/ssh/putty/mac>

<https://termius.com/free-ssh-client-for-mac-os>

## Other Resources for application

### QoS

The user may apply additional QoS for...

- longer computation hour, selecting range: 8-hr, 12-hr, 24-hr, till max 48-hr
- computation with more resource allocation: CPUs, Memory, and GPU Card

Usage period: 1-month

Method to apply:

- Must provide valid *Reason for the usage* and *Verification* ( latest coding and computation result executed in TC1 with the assigned QoS ), to prove that the existing resource unable to support the user's requirement for computation
- Send the request e-mail to CCDSGPU-TC-Support [[CCDSgpu-tc@ntu.edu.sg](mailto:CCDSgpu-tc@ntu.edu.sg)]
- The administrator will evaluate, verify on the real requirement, and then assign the QoS accordingly
- The requestor will be notified, upon successful application

### Additional Storage Space

The user may apply additional storage space for computation data more than 100GB

A share folder will be created in another storage to assign to the user.

Usage period: 4-months

Maximum usage quota: depending on the available free space and approval

Method to apply:

- Send the request e-mail to CCDSGPU-TC-Support [[CCDSgpu-tc@ntu.edu.sg](mailto:CCDSgpu-tc@ntu.edu.sg)]
- Must provide the reason and verification for the usage request
- The user will be receiving the PFD form via e-mail, to complete for the application
- The user will be notified of the resource assignment, upon successful application

### Terms and Conditions

- The application approval is subjecting to usage purpose, resource availability, cluster operational workload and administration criteria
- The usage of the assigned resource will be monitored
- The administrator claims the right to revoke the assigned resource if the usage has been verified underuse or impacting on the operation in the GPU Cluster
- The assigned resource will be removed upon usage expiry, with no prior notification

## Important Notice

1. This User Guide is only providing general information for your kick-start in TC1. If you want in-depth information, you may visit those suggested Online References (*URL*) providing in the guide or search the internet for your required information.
2. There is NO backup provided for data stored in your home directory. You are responsible for protecting and maintaining your own data.
3. The resources in TC1 are to be used for academic purposes only. Use of resources for a purpose other than that for which they were granted will result in the termination of account.
4. Your access and computation are being monitored. For unauthorized computation impacting on the operation in TC1 and for jobs submitted with unauthorized QoS (NOT assigned for your use), will be terminated with no prior notification. Severe offender will be barred from the service.
5. DO NOT access directories other than your Home Directory and Shared folder. Unauthorised access to other directories or files, even for the purpose of “browsing”, shall be deemed as a security breach. Serious action will be taken against users committing any breach to the CCDS GPU Cluster.
6. For issue regarding your coursework and project, please consult your Supervisor or TA (Teaching Assistant).
7. For technical issue, drop an email to CCDSGPU-TC-Support [[CCDSgpu-tc@ntu.edu.sg](mailto:CCDSgpu-tc@ntu.edu.sg)]

~ End ~
